

Task 1 - QA & Debug Report (TodoMVC Website)

Website Tested: <https://todomvc.com/examples/react/dist/> The website was tested for: - adding tasks - editing tasks - deleting tasks - marking completed tasks - validation - usability and performance

#	Issue	Steps	Expected vs Actual	Severity	Cause
1	Empty task accepted	Press enter with spaces	Should reject empty task but accepts it	Medium	Missing validation
2	Very long task breaks UI	Add very long text	UI should stay aligned but breaks	Medium	CSS overflow issue
3	No undo after delete	Delete task accidentally	Should allow undo but permanently deletes	Low	Missing recovery feature
4	No loading indicator	Refresh quickly	Should show loading state but none visible	Low	UX improvement missing
5	Mobile alignment issue	Open on small screen	UI should stay responsive but elements overlap	Medium	Responsive CSS issue

Root Cause Analysis: The issue chosen is the acceptance of empty tasks. When the user presses enter using only spaces, the application still creates a task. This happens because the input is not properly trimmed before validation. As a result, blank entries appear in the task list and reduce user experience quality. To fix this issue: - trim input values before submission - validate empty strings - show warning messages for invalid entries This would improve usability and data quality.
